PRATT NOISE ISSUE UPDATE – December 9, 2014

Dear Vista Ridge Neighbors,

We take your concerns regarding sound levels very seriously and are cognizant of the impacts our operations are having on you. Based on your feedback and our site evaluations, we recently started implementing additional steps to mitigate the noise issues related to Encana's operations. We hope you will notice a marked improvement very soon, if you haven't already. As we make these improvements, we will communicate updates through this page as a venue for sharing information. Here's an update as of today.

We are implementing several mitigation measures at the site that we believe should address noise issues in general. It is our intent that the variety of steps we take will enable us to decrease the noise impacts at this location. Some of the steps we have already taken include: the installation of additional sound abatement blankets, closing the existing gaps in the sound walls, positioning portable sound walls around the generators, and replacing the sound walls on the south side of location with an alternative abatement material.

Encana is aware of your frustration. Many of you have asked, "Why don't you just shut it down until you figure this out?" Halting operations while drilling the well creates operational challenges as well as safety concerns. Once we reach total depth and run production casing in the current well, we will temporarily halt operations at this location. We will use this time to evaluate the steps we've taken to-date and implement additional sound mitigation measures. The exact timing is not yet known, but we anticipate a temporary halt will be initiated within a week.

Thank you for your candid feedback and continued patience.
